

MODULE 7

Notifications & Staying on Top of Activity

Goal: Get the right alerts at the right time — without notification overload.

IN THIS MODULE

- 01 Notification types: task due, new conversation, deal update
- 02 Setting preferences so you see what matters
- 03 Badge counts — what each number means
- 04 Notifications screen vs. the Inbox — knowing where to look
- 05 Avoiding notification fatigue

Notification Types

webXpanse sends two kinds of notifications: in-app (bell badge) and email. You control exactly which events trigger which type.

? *Too many notifications means you'll start ignoring them. Set only the ones you'll actually act on.*

- Task Due — your task has reached its due date
- Task Overdue — a task is past its due date
- New Conversation — someone replied to your email or WhatsApp
- Deal Updated — a deal you own or follow changed stage
- New Contact — a form submission created a new lead
- Deal Won / Deal Lost — outcome events on your pipeline
- Mention — a teammate mentioned you in a note or activity

? The notifications screen is for catching up. The Inbox is for acting. Don't confuse the two.

Setting Notification Preferences

Notification Preferences lets you choose per event type: email, in-app, both, or neither. Set these in week one and review monthly.

- Access: ? icon in top nav ? Notification Preferences
- Each event type has Email and In-App toggles — set independently
- Recommended in-app only: Task Due, New Conversation, Mention
- Recommended email + in-app: Task Overdue, New Lead, Deal Won
- Recommended off (to avoid noise): minor system updates, auto-log confirmations
- Changes take effect immediately — no save button needed

Badge Counts — What the Numbers Mean

The bell icon in the top navigation shows a red badge with your unread notification count. Other badges appear on different nav icons.

- Bell badge — unread in-app notifications
- Number on Inbox icon — unread conversations
- Task count on Dashboard — pending + overdue tasks
- Goal: bell badge at zero by end of each day
- High badge counts signal: too many events, or too little response time

Notifications Screen vs. Inbox

These are two different tools. Confusing them wastes time. Use each for its purpose.

- Notifications Screen — a log of events: task alerts, deal changes, system events
- Inbox — a working tool: reply to messages, triage, assign, resolve
- Workflow: check Notifications to see what's new ? go to Inbox to act on conversations
- Clear notifications by clicking them — they mark as read when opened
- Bulk mark-all-read if the count is too high — start fresh

Avoiding Notification Fatigue

Notification fatigue happens when you receive so many alerts that you start ignoring them all — including important ones. Prevent it with a disciplined preference setup.

- Rule 1: Only enable notifications for events you will act on within 24 hours
- Rule 2: If you've ignored a notification type 3 times, disable it
- Rule 3: Check notifications at set times (9am, 1pm, 4pm) — not constantly
- Rule 4: Use the Inbox for conversations, not notifications
- Rule 5: Review your preferences monthly — needs change as your volume grows

? Module 7 Exercise — Notifications

Step-by-step:

- 1 Open Notification Preferences (? icon ? Notification Preferences).
- 2 Review every event type. For each: ask "Will I act on this within 24 hours?"
- 3 Turn off any notification type you would realistically ignore.
- 4 Enable email notifications for: Task Overdue and New Contact.
- 5 Set in-app only for: Task Due, New Conversation, and Mention.
- 6 Open the Notifications screen and clear all unread by clicking each one.
- 7 Check your bell badge at 9am, 1pm, and 4pm for 3 days. Note your average count.

QUICK REFERENCE

- Notification Preferences URL: acrm.webxpanse.com/notification_preferences.php
- Notifications screen URL: acrm.webxpanse.com/notifications.php
- Bell = notification log. Inbox = action space. Use them differently.
- Zero unread bell by end of day = healthy notification discipline.
- If your badge is always >20, your preferences need a reset.
